

01 — BEFORE

Tabletop scale.

LEGO · SMALL OBJECTS · ARMS-LENGTH

The original frame was about **precision pointing** at small objects within reach.

*But precision at that scale is already a solved problem — a screen can show you where to put a piece, a voice can say "third hole from the left."*

Pointing was **competing with modalities that already worked.**

02 — AFTER

Room scale.

SXL · LAB EQUIPMENT · ACROSS THE SPACE

When you're standing in a space and don't know where something is, **language breaks down completely.**

*"It's on the shelf near the window" still requires you to find the shelf, find the window, interpret near.*

A **laser dot on the object across the room** is instantaneous. No translation.

03 — INSIGHT

Pointing's unique affordance only becomes visible **at room scale.**

The pivot wasn't a change in scale — it was realizing that **pointing only solves a problem nothing else can** when language and screens stop reaching.

Tabletop was a competition. Room scale is a category of one.
